

New perspectives on electrons in chiral molecules

Karen Michaeli, Department of Condensed Matter Physics, Weizmann Institute of Science

Abstract:

Recent insights, largely based on groundbreaking experimental studies of chiral organic molecules, have raised important questions about the role of spin in biological processes. They also suggest the possibility of a new class of organic-based nanoscale devices. In my talk, I will discuss some of the key developments regarding spin selectivity; I will overview new questions that arise from these results and offer our ideas for their resolution.
